

# Profile Pre-Treatment

## Edge brushes - EBI; EBr

The edge brush is used for cleaning the profile edge. It is adjustable in width and height using standard brackets. The brush can also be swiveled to accommodate different angles. A dust extraction hood is provided.

## Surface brush - ST

The surface brush is used for cleaning the top surface of the profile. The brush width is according to the working width of the machine. There is a dust extraction hood provided and the unit is height adjustable by means of spindle.

## Primer station - PA

This station is used to apply a primer coat to the surfaces that are going to be profile wrapped. The primer is applied by means of felt pads that are shaped to fit the profile. Multiple felt pads as well as a reservoir for the primer are provided.

**None flammable primer is to be used.**

## IR heaters - HS (1500 kW); HL (3000kW)

These heaters are used to pre-heat the profile before laminating. The outlets for the heaters are interlocked with the transport drive for added safety.

**Other units for pre-treating are available for specific needs**
