

# RT/MT Trimming Station

## Features

- ▷ High frequency motors
- ▷ Three axis adjustable
- ▷ Safety cover with electric door locks
- ▷ Motor speed adjustable
- ▷ Rotation of motors easy to change
- ▷ The Station can be added at a later stage

## In-line Trimming of Overlay Material

The trimming station consists of two trimming motors with saw blades and extraction hoods in a safety enclosure. Two versions of the Trimming Station are available.

One is the model MT. The MT is manually adjustable by means of spindles. The trimming motors can be adjusted in height, width and angle to accommodate various profile shapes.

The second version is called the RT. In the RT model the trimming motors are pre-adjusted to the profile edge using servomotors. They are controlled by means of joystick. Then the safety doors are closed and the fine adjustment is done remotely. Four dials are mounted in a separate operator panel, two for each trimming motor. These dials control the adjustment for the height and the width. One full revolution of each dial is 1 mm of adjustment.
